EDUCATION

Simon Fraser University **Vancouver, Canada**
B.S. in Computer Science *Expected Graduation, January 2028*

- **Concentrations:** Artificial Intelligence

TECHNICAL SKILLS

Languages: C++, C, Java, Python, HTML/CSS, MATLAB
Tools: IntelliJ, Eclipse, Git, GitHub Actions
Data & Web Frameworks: Pandas, NumPy, Streamlit, yfinance, Finnhub API

EXPERIENCE

Puzzled Looks **North Vancouver, Canada**
Licensed Optician & Technical Lead *Jan 2022 – present*

- Developed and deployed the clinic's customer-facing website using WordPress, increasing patient engagement and streamlining appointment bookings.
- Diagnosed and resolved complex software interoperability issues between patient management systems and diagnostic optical equipment, serving as the primary on-site IT support to minimize operational downtime.
- Communicated technical optical concepts to diverse patient demographics, translating complex data into actionable health advice

TECHNICAL PROJECTS

AI-Powered Stock Predictor
Solo/Lead Developer *May 2025 – April 2026*

- Architected a full-stack financial analysis application that generates real-time stock predictions using a hybrid LSTM Neural Network and Monte Carlo Simulation.
- Integrated FinBERT (NLP) to perform sentiment analysis on over 4,500+ historical news headlines per ticker, converting unstructured text into quantitative risk signals.
- Engineered a robust data pipeline that fetches 1 year of financial data via Finnhub and yfinance, implementing batch processing to optimize memory usage and prevent OOM crashes during inference.
- Built an interactive Streamlit dashboard allowing users to trigger on-demand model training for any stock symbol, visualizing "Cone of Probability" long-term forecasts.

Automated Stock Analyst Filter
Solo/Lead Developer *Nov 2025 – Dec 2025*

- Built a full-stack financial analysis tool that scans 1,500+ stocks across US and Canadian markets (S&P 500, Nasdaq 100, TSX, Russell) to identify high-upside investment opportunities.
- Engineered a robust ETL pipeline using yfinance and pandas to aggregate real-time pricing, analyst ratings, and valuation metrics (P/E ratio) into a unified dataset.
- Implemented complex filtering algorithms to cross-reference analyst ratings with current stock performance, successfully identifying undervalued securities and reducing manual research time by 90%
- Implemented CI/CD automation via GitHub Actions to run daily scheduled data scrapes, handling API rate limits and error recovery automatically.
- Deployed an interactive web dashboard using Streamlit, featuring advanced filtering, caching for performance, and responsive data visualization.

Dungeon Escape (Java Game)
Team Developer *Sep 2025 – Dec 2025*

- Architected and implemented a multi-component application in Java using object-oriented design principles
- Orchestrated build automation and dependency management by configuring Maven, ensuring a consistent development environment for all team members.
- Applied version control with Git in a team environment, managing branches and resolving conflicts
- Wrote unit tests to validate edge cases and ensure correctness under input constraints
